			ART UNIT 1734	PAPER NUMBER
			MAIL DATE 07/25/2007	DELIVERY MODE PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

**Office Action Summary**

Application No.

10/726,584

Applicant(s)

JUNG ET AL.

Examiner

George R. Koch III

Art Unit

1734

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 02 July 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-15 is/are pending in the application.
- 4a) Of the above claim(s) 11-15 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-10 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some \* c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date 2/13/04; 10/17/06; 4/9/07.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_.

## DETAILED ACTION

### *Election/Restrictions*

1. Applicant's election without traverse of group I, claims 1-10 in the reply filed on 7/2/2007 is acknowledged.

### *Claim Rejections - 35 USC § 102*

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-10 are rejected under 35 U.S.C. 102(b) as being anticipated by Ishida (JP06-114,315; machine translation included).

As to claim 1, Ishida discloses a dispenser (see Figures 1-5 and the entire specification) capable of operating on a liquid crystal display panel, comprising:

a syringe (cartridge 2) having a nozzle (nozzle 1) provided at an end thereof; a body in which the syringe is mounted (Z axis table section 4);

a vertical driving stepping motor for moving the body in a vertical direction (motor 18, and see also figure 4, which shows the motor 18 interacting with items a Z axis motor controller 20 and z-axis motor driver 21; see also paragraphs 0023-0026, especially 0025, for the operation;

a first sensor (Contact detection sensor 13) for detecting whether the nozzle of the syringe is in contact with a substrate (the abstract recites that the paste nozzle is brought into contact

Art Unit: 1734

with the base, and “the contact is detected by the contacting detection sensor 13”; see also paragraphs 0014-0018, which describes the contact detecting sensor’s function);

a second sensor (optical displacement sensor 3) for detecting a gap distance between the nozzle and the substrate (see also paragraphs 0019-0022);

and a main unit for controlling (control unit 11) the vertical driving stepping motor (motor 18, controlled by electrical control elements of the Z-axis motor controller 20 and Z axis motor driver 21) in response to an output from the second sensor to obtain a desired gap distance between the nozzle and the substrate (Figure 4 shows this operation; see especially paragraph 0025, which relates the optical displacement sensor input to the controller outputs).

As to claim 2, Ishida discloses that the first sensor is a magnetic sensor (Ishida discloses a magnetic eddy current sensor; see paragraph 0016 which discloses the magnetic flux).

As to claim 3, Ishida discloses that the second sensor is a laser displacement sensor (see paragraph 0020, which discloses that the optical displacement meter includes a light emitting device emits a laser beam which is received by a photodetector; i.e., a laser displacement sensor).

As to claim 4, Ishida discloses a table for mounting the substrate (see items 5, 6, and 8 in Figure 1).

As to claim 5, Ishida discloses that the table is horizontally movable in forward/backward and left/right directions (via the operation of the X axis table section and the Y axis table section, which move the substrate adsorption section 8).

As to claim 6, Ishida discloses that the second sensor comprises: a light emitting unit for irradiating laser on the surface of the substrate; and a light receiving unit for receiving laser

Art Unit: 1734

reflected from the substrate (see paragraph 0020, which discloses that the sensor includes a light emitting device emits a laser beam which is received by a photodetector).

As to claim 7, Ishida discloses that the light receiving unit detects a gap distance between the nozzle and the substrate according to a position on a surface of the light receiving unit (paragraph 0020 talks about measuring the distance between the nozzle and substrate, i.e., the gap distance between the nozzle and the substrate).

As to claims 8, 9, or 10, the apparatus and cartridge of Ishida is capable of being filled with sealant, liquid crystal, or Silver (Ag). Furthermore, the manner of operating the device does not differentiate apparatus claim from the prior art. MPEP 2114. The choice of dispensing material can be interpreted as a manner of operating the device, and under MPEP 2114, it does not differentiate apparatus claims from the prior art. The material or article worked upon does not limit apparatus claims. MPEP 2115. The sealant, liquid crystal or silver can be interpreted as the material worked upon by the dispenser, and therefore, under MPEP 2115, it would not limit the apparatus claims.

#### ***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 1734

5. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

6. Claims 1-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ishida (JP06-114,315; machine translation included) in view of Stepper Motor System Basics, published at [www.ams2000.com](http://www.ams2000.com) on 8/7/2000.

As to claim 1, Ishida discloses a dispenser (see Figures 1-5 and the entire specification) capable of operating on a liquid crystal display panel, comprising:

a syringe (cartridge 2) having a nozzle (nozzle 1) provided at an end thereof; a body in which the syringe is mounted (Z axis table section 4);

a vertical driving stepping motor for moving the body in a vertical direction (motor 18, and see also figure 4, which shows the motor 18 interacting with items a Z axis motor controller 20 and z-axis motor driver 21; see also paragraphs 0023-0026, especially 0025, for the operation;

a first sensor (Contact detection sensor 13) for detecting whether the nozzle of the syringe is in contact with a substrate (the abstract recites that the paste nozzle is brought into contact with the base, and "the contact is detected by the contacting detection sensor 13"; see also paragraphs 0014-0018, which describes the contact detecting sensor's function);

a second sensor (optical displacement sensor 3) for detecting a gap distance between the nozzle and the substrate (see also paragraphs 0019-0022);

Art Unit: 1734

and a main unit for controlling (control unit 11) the vertical driving motor (motor 18, controlled by electrical control elements of the Z-axis motor controller 20 and Z axis motor driver 21) in response to an output from the second sensor to obtain a desired gap distance between the nozzle and the substrate (Figure 4 shows this operation; see especially paragraph 0025, which relates the optical displacement sensor input to the controller outputs).

Ishida appears to disclose a step/stepping/stepper motor, since it talks about “measures the rotation of the motor” (see paragraph, 0025) actions which suggest that the motor rotates in steps. In any event, it would have been obvious to use a stepper motor. Among the well known benefits of stepping motors are accurate control of the movement of the object, by allowing partial rotation of the motor (see, for example, the Stepper Motor System Basics, introduction section on page -2), and especially has the benefits of low cost, high reliability, high torque at low speeds, and a simple, rugged construction that operates in almost any environment. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to have utilized a stepping motor in order to achieve the benefits of low cost, high reliability, high torque at low speeds, and a simple, rugged construction that operates in almost any environment.

As to claim 2, Ishida discloses that the first sensor is a magnetic sensor (Ishida discloses a magnetic eddy current sensor; see paragraph 0016 which discloses the magnetic flux).

As to claim 3, Ishida discloses that the second sensor is a laser displacement sensor (see paragraph 0020, which discloses that the optical displacement meter includes a light emitting device emits a laser beam which is received by a photodetector; i.e., a laser displacement sensor).

Art Unit: 1734

As to claim 4, Ishida discloses a table for mounting the substrate (see items 5, 6, and 8 in Figure 1).

As to claim 5, Ishida discloses that the table is horizontally movable in forward/backward and left/right directions (via the operation of the X axis table section and the Y axis table section, which move the substrate adsorption section 8).

As to claim 6, Ishida discloses that the second sensor comprises: a light emitting unit for irradiating laser on the surface of the substrate; and a light receiving unit for receiving laser reflected from the substrate (see paragraph 0020, which discloses that the sensor includes a light emitting device emits a laser beam which is received by a photodetector).

As to claim 7, Ishida discloses that the light receiving unit detects a gap distance between the nozzle and the substrate according to a position on a surface of the light receiving unit (paragraph 0020 talks about measuring the distance between the nozzle and substrate, i.e., the gap distance between the nozzle and the substrate).

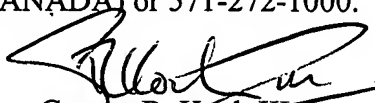

As to claims 8, 9, or 10, the apparatus and cartridge of Ishida is capable of being filled with sealant, liquid crystal, or Silver (Ag). Furthermore, the manner of operating the device does not differentiate apparatus claim from the prior art. MPEP 2114. The choice of dispensing material can be interpreted as a manner of operating the device, and under MPEP 2114, it does not differentiate apparatus claims from the prior art. The material or article worked upon does not limit apparatus claims. MPEP 2115. The sealant, liquid crystal or silver can be interpreted as the material worked upon by the dispenser, and therefore, under MPEP 2115, it would not limit the apparatus claims.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to George R. Koch III whose telephone number is (571) 272-1230 (TDD only). If the applicant cannot make a direct TDD-to-TDD call, the applicant can communicate by calling the Federal Relay Service at 1-866-377-8642 and giving the operator the above TDD number. The examiner can also be reached by E-mail at [george.koch@uspto.gov](mailto:george.koch@uspto.gov) in accordance with MPEP 502.03. The examiner can normally be reached on M-F 9-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Philip Tucker can be reached on (571) 272-1095. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
